

Create a new React application user-account-app.

Add new component 'User-login' with features as below

Two input text fields for login name and password with login button as submit button.

On the submit action, compare the user entered values to dummy values like username = admin and password=admin.

On successful login, it should redirect to user-account page displaying user account details.

In case of password not matching, it should stay on the same screen with RED color highlighted message which should be hidden in normal and initial login.

In case of username not matching it should redirect to user-registration page with component 'user-register' with the RED highlighted message that username not found and pointing to add new user section?

The component 'user-register' will have username, password, confirm password and email elements with validation of username having minimum 8 characters and both passwords must match.

In case of any matching error, it should stay on the same page with cursor on the error element and red colored highlighted message indicating cause of errors.

The user-account page displays following features with all components displayed on the page.

It should carry the same login user name across all other options.

(Use dummy values wherever required.

Later on get and compare the values with REST API from server.)

Account-Summary

Displays the account details in read only mode.

Account Name, Balance, and email and address details.

Account-Update

Provision to update email, password and address details. Here the earlier **component 'user-register'** **should be reused** with submit button captions change like **add → update** and **username should not be editable.**

Update Nominee

Provision to add/update nominee with fields as

Name, age, married/unmarried (radio button), birthdate, relation, Drop down for available residence options, beneficiary amount percentage.

Credit Cards

The current outstanding and credit balance should be displayed with credit card number as read-only with provision to add/link more credit cards to the account.

This action should have option to pay for credit card amount by selecting the card from available options for selecting the card and payment options as drop down as NEFT, Direct, and scheduled to from another external bank account.

Transfer Funds

The user should be able to transfer the specified amount from available accounts to other external bank accounts.

New Account

Provision to add new account with current bank for the current username with account details as saving/current, self or joint operated, in case of joint operations, provision to add multiple account holders. Options such as **Name, age, married/unmarried (radio button), income sources as multiple checkboxes as salary, house rent, Drop down for available identity options.**

Logout

When clicked on this the current username should be empty and should redirect to login page and clearing the browser history, so that user cannot move back and forward pages after this action.
